1. What is a LAN?

A Local Area Network (LAN) is a network that connects computers and devices within a limited area such as an office building, school, or home. LANs facilitate high-speed data transfer and resource sharing among connected devices. They are typically characterized by their geographic proximity, high data transfer rates, and use of Ethernet or Wi-Fi technologies.

2. What is the purpose of a firewall?

A firewall acts as a security barrier between a trusted internal network and untrusted external networks, such as the internet. Its primary purpose is to monitor and control incoming and outgoing network traffic based on predetermined security rules, thereby preventing unauthorized access and potential threats.

3. Define IP address.

An Internet Protocol (IP) address is a unique numerical label assigned to each device connected to a network. It serves two main functions: identifying the device's location within the network and facilitating communication between devices. IP addresses can be IPv4 (e.g., 192.168.1.1) or IPv6 (e.g., 2001:0db8:85a3::8a2e:0370:7334).

4. What are the differences between TCP and UDP?

TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) are both transport layer protocols used for data transmission. The main differences are:

- **Reliability:** TCP provides reliable, ordered, and error-checked delivery of data. UDP does not guarantee delivery, making it faster but less reliable.
- **Use cases:** TCP is used for applications requiring accuracy, such as web browsing and email. UDP is suited for applications where speed is crucial, like live streaming or online gaming.
- **Connection:** TCP establishes a connection before data transfer; UDP is connectionless.

5. What is a subnet mask?

A subnet mask is used in IP networking to divide an IP address into network and host portions. It

determines which part of the IP address refers to the network and which part refers to the device (host). Common subnet masks include 255.255.255.0 for a Class C network.

Technical Definitions Explained

Providing clear explanations of technical terms helps solidify understanding. Here are some essential definitions:

Packet

A packet is a formatted unit of data carried over a network. It contains not only the payload (actual data) but also control information such as source and destination addresses, error-checking data, and sequencing information.

Switch

A network device that connects multiple devices within a LAN and uses MAC addresses to forward data only to the intended recipient, improving efficiency and security compared to hubs.

Router

A device that connects multiple networks and routes data packets between them based on IP addresses. Routers enable communication between LANs and the internet.

VPN (Virtual Private Network)

A service that creates a secure, encrypted connection over a less secure network, such as the internet. VPNs ensure privacy and security for remote users accessing corporate resources.

Common Network Devices and Their Functions

Understanding hardware components is crucial for practical knowledge:

- **Hub:** A basic device that broadcasts incoming data to all connected devices. Less efficient and largely obsolete.
- **Switch:** Directs data to specific devices based on MAC addresses, increasing network efficiency.
- **Router:** Connects different networks and manages traffic between them.
- **Access Point:** Extends a wired network by adding Wi-Fi capability, allowing wireless devices to connect.

- **Modem:** Converts digital data to analog for transmission over telephone lines and vice versa.

Security Concepts in Session 3

Security is a critical aspect of networking. Key concepts include:

Encryption

The process of converting data into a coded form to prevent unauthorized access during transmission or storage. Common encryption protocols include AES and SSL/TLS.

Authentication

Verifying the identity of a user or device before granting access to resources. Methods include passwords, biometrics, and two-factor authentication.

Malware

Malicious software designed to damage, disrupt, or gain unauthorized access to systems. Examples include viruses, worms, spyware, and ransomware.

Troubleshooting Tips for Network Issues

Effective troubleshooting is essential for maintaining network health. Here are some basic steps:
